Box 57 , Section 2

LITHOLOGY PETROGRAPHY - continues unit 58.1

Grey sand and gravel unit, clasts are subrounded to angular, poorly sorted ranging in size from 1-5mm. Fragments consist of clasts of basalt, silt?, and feldspar crystals. Matrix about 10% of rock, very fine-grained, dark grey to black.

345.92 Band of finely laminated black silt with one band, 3mm wide of poorly sorted sand and gravel. Fragments similar to above.

346.03 Graded sand and gravel sequences. Clast size coarsens downward. Size ranges from less than 1mm to 10mm. Fragments are subrounded to angular and consist of grey basalt (about 40%), brown silt? (about 5%) and white feldspar crystals (about 55%). Colour is grey. Matrix less than 10% of rock. Consists of very fine-grained, grey to black material.

VESICLES/AMYGDALES

None observed.

FRACTURES - VEINS - BRECCIA

Unit is not highly fractured. Silt unit breaks along bedding planes.

ROCK ALTERATION

346.00 - 346.20 Fine grained portion of sandstone has pervasive green alteration.

STRUCTURE

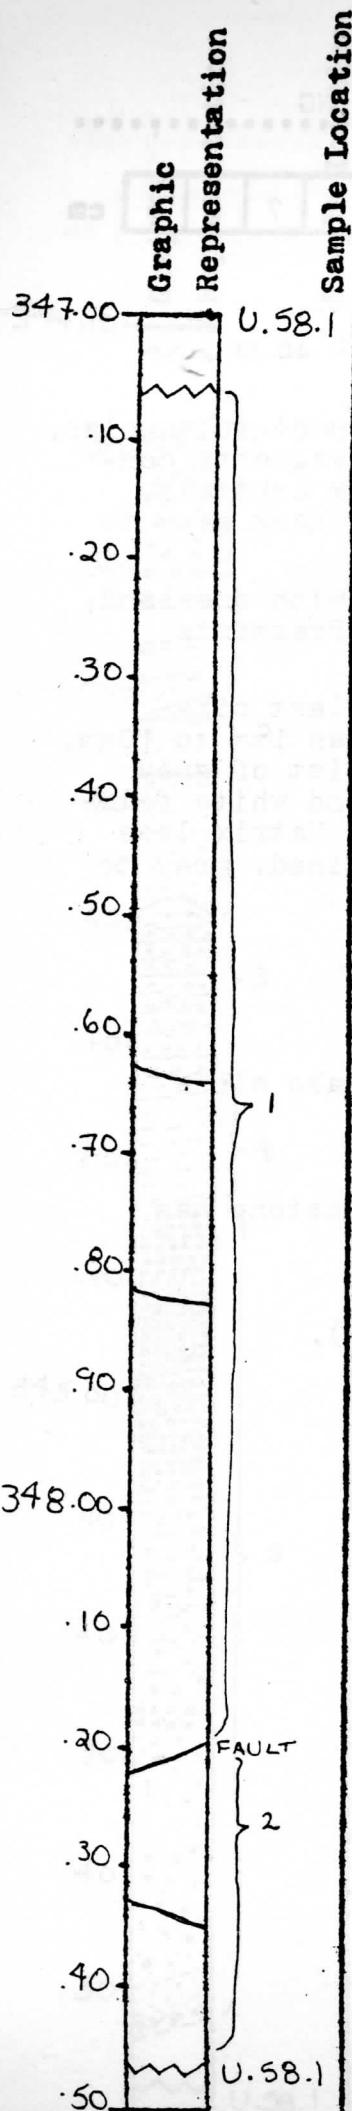

Various layers of graded bedding (unit 58.1).

ICELAND RESEARCH DRILLING PROJECT

Visual Core Description Observer NG

Depth Interval 3 4 7 0 6 cm to 3 4 9 4 7 cm

Box 58 , Section 3

LITHOLOGY PETROGRAPHY - continues unit 58.1

Medium- to coarse-grained, poorly sorted, grey sand and gravel. Clasts are subrounded to angular and consist of about 40% grey basalt, 5% red silt?, and 55% white felsic fragments. Matrix is less than 10% of rock and is very fine-grained, grey material.

348.02 There are irregular 3cm wide bands of grey silty material.

Lower portion of unit has 5cm band of dark grey coarse- to fine-grained sediment. Fining downward with flow banding. Clast are subrounded about 10% feldspar 2-3mm long. The remainder of the fragments are basaltic? Matrix is fine-grained, black.

348.20 Laminated silt, sand and gravel. Beds are 2-3cm to 10cm thick. Grain size coarsens downward.

VESICLES/AMYGDALES

None observed.

FRACTURES - VEINS - BRECCIA

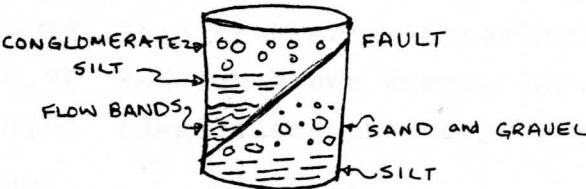

Most breaks in core lined with green and red soft mineral.

348.20 Vein is approximately 2mm wide and filled with calcite, and green and red smectite? Slickensides on smectite surface. Interpreted to be fault surface.

ROCK ALTERATION

None observed.

348.18 - 348.24

STRUCTURE

Various layers of graded sediment, with some flow banding (unit 58.1).

FAULT

2

348.00 - 348.10 Fine-grained, angular basalt (unit 58.1); Breccia.

348.10 - 348.18 Fine- to medium-grained bedded sediments.

348.18 - 348.22 Taifaceous sediment (unit 58.1).

348.22 - 348.23 Fine-grained sediment (unit 58.1).

348.23 - 348.27 Medium-grained, graded bedded layers (unit 58.1).

Box 58 , Section 4

LITHOLOGY PETROGRAPHY - continues unit 58.1

Continued from above. Waterlai crystalline tuff - interpretation of unit. Consists of interlayered coarse and fine grained material. Bands are $\frac{1}{2}$ -1cm thick - similar to above.

348.64 Dark green, medium- to fine-grained, poorly sorted tuffaceous unit with flow banding. Feldspar crystals are absent. Fragments are subrounded to angular 1-3mm in size, and consist of basaltic material? Matrix is very fine-grained, dark green material.

VESICLES/AMYGDALES

None observed.

FRACTURES - VEINS - BRECCIA

Most breaks are along bedding planes. Surface of break is coated with a thin layer of soft, green smectite?

349.75 Break is irregular. Shiny green smectite? with slickensides is on surface of break.

ROCK ALTERATION

Pervasive alteration to green smectite?

STRUCTURE

Tuffaceous segment with some flow banding (unit 58.1).

cm

Box 59 , Section 1

LITHOLOGY PETROGRAPHY - continues unit 58.1

Fine to coarse grained bedded sequence of tuffaceous material. Dark green to purplish-green colour. Layers vary from well sorted sand or silt sized material to more massive beds of angular to subrounded 1mm clasts (about 40-50%) in fine-grained matrix (about 50%). Some layers are graded, 4-5cm thick, and grade downward to coarse grained layer with 3-5mm subrounded fragments with some flow banding.

350.99 Fault. Lithology is the same above and below the fault. Fault recognized by truncation of beds and change in local lithology across fault plane. Also slickenside on surface.

VESICLES/AMYGDALES

None observed.

FRACTURES - VEINS - BRECCIA

Most fractures shown are breaks along bedding planes. They are lined with a thin layer of green smectite.

349.99 Fracture has shiny green smectite with slicken-sides. It has angle of 40° to assumed horizontal.

350.99 Fault contains green and red smectite and minor amounts of calcite.

ROCK ALTERATION

Pervasive alteration to green and red smectite?

STRUCTURE

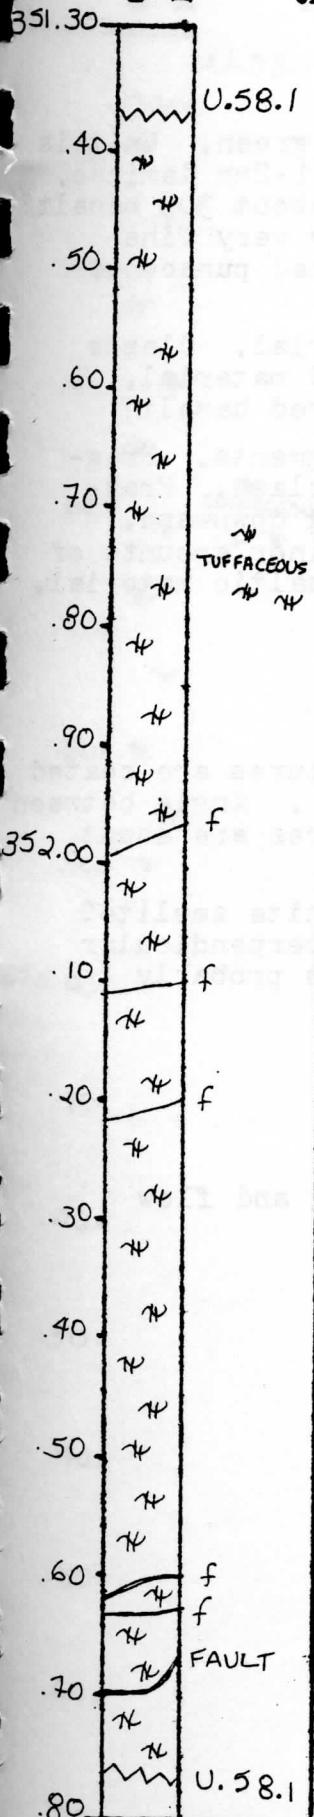

Tuffaceous segment with some graded bedding, flow banding (unit 58.1).

ICELAND RESEARCH DRILLING PROJECT

Visual Core Description Observer NG

Depth Interval 3 5 1 3 7 cm to 3 5 2 7 6 cm

Box 59 , Section 2

LITHOLOGY PETROGRAPHY - continues unit 58.1
 Tuffaceous unit. Continued from above. Unit is mottled purple-green grey. Fragments are about 3mm long, black, angular, basaltic?, matrix is very fine-grained, green material. Has flattened pumaceous fragments.

351.40 Consists of poorly, fine- to coarse-grained, more massive material without flattened pumice. Clasts are as above with rare crystals of feldspar, 2-3mm long.

351.49 As above but with flattened pumaceous fragments and rare laminae 1-2mm thick of fine-grained material.

352.40 Fine to coarse grained, bedded, with some thin (about 1mm) fine-grained laminae, some flattened pumaceous fragments, and angular basaltic clasts.

352.60 Calcite along bedding plane is 14mm red fragment.

352.69 Fault identified by truncation of fine-grained dark green layer about 4mm thick and slickensides on fault surface. Core angle fault about 70° .

VESICLES/ALYGDALES

None observed.

FRACTURES - VEINS - BRECCIA

Unit breaks easily along bedding planes.

352.60 - 352.70 Fractures are lined with shiny green smectite with slickensides on surface.

352.69 Fracture also contains calcite and red clay?

352.70 Minor, irregular hairline fractures filled with calcite.

ROCK ALTERATION

Pervasive alteration to green smectite?

STRUCTURE

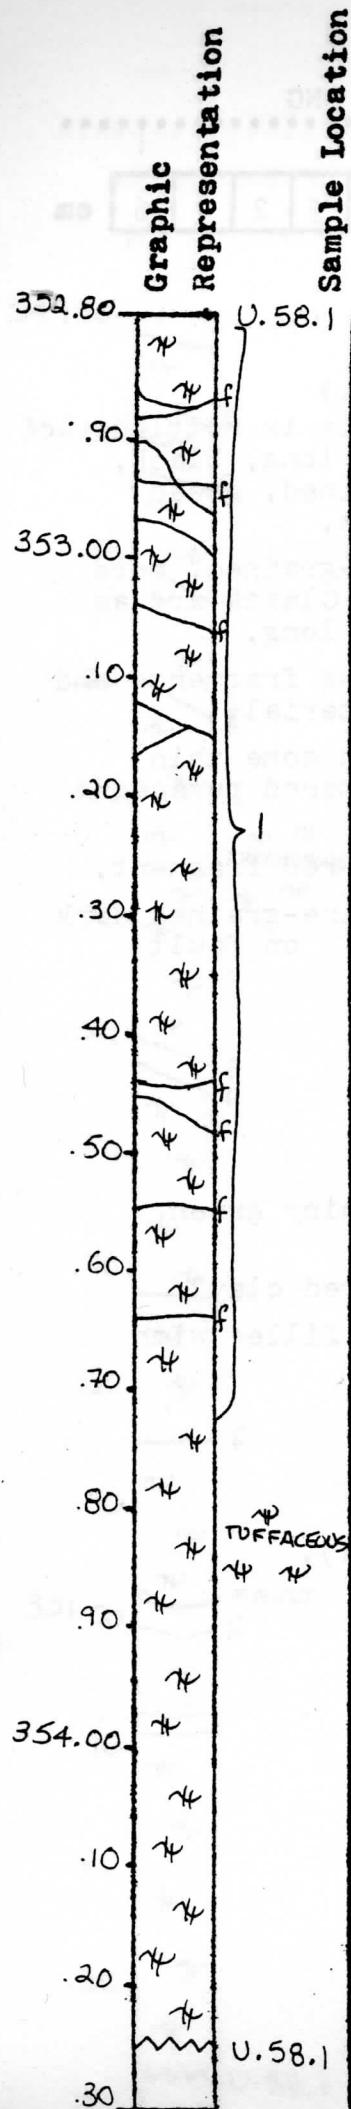

Tuffaceous segment , some bedding (unit 58.1).

ICELAND RESEARCH DRILLING PROJECT

Visual Core Description Observer NG

Depth Interval 3 5 2 7 6 cm to 3 5 4 2 5 cm

Box 59, Section 3

LITHOLOGY PETROGRAPHY - continues unit 58.1
Tuffaceous unit from above. Colour is dark green. Unit is bedded. Beds range in thickness from thin, 1-2mm laminae, to 20cm thick. Unit consists primarily of about 30% basalt? Sand and gravel size fragments surrounded by very fine-grained green matrix containing some flattened pumaceous fragments. Continues to 353.75.

353.40 There is a 7cm band of coarser material. Clasts are $\frac{1}{2}$ -1cm in size, primarily black basaltic? material, about 5% of fragments are red. May be altered basalt?

353.75 Unit consists of about 90% rock fragments. Fragments are basalt with phenocrysts of plagioclase. Fragment size ranges from 2mm to 1cm, coarsening downward. Matrix is very fine-grained. Consists of minor amounts of calcite, white zeolite?, green and black basaltic material.

VESICLES/AMYGDALES

None observed.

FRACTURES + VEINS - BRECCIA

Rock has broken along fractures. Most fractures are coated with shiny green smectite with slickensides. Angle between perpendicular to core axis and these fractures are about 40° .

352.90 and 353.50 Fractures also contain white zeolite? Those fractures that are about parallel to perpendicular to core axis are breaks along bedding planes probably caused by drilling.

ROCK ALTERATION

Pervasive alteration to green smectite.

STRUCTURE

Tuffaceous segment with some graded bedding and flow banding (unit 58.1).

ICELAND RESEARCH DRILLING PROJECT

Sample Location

LITHOLOGY PETROGRAPHY - continues unit 58.1
Tuffaceous unit continued from above. Colour - mottled and banded green and purplish-green. Grain size and sedimentary and volcanic structures are highly variable. Fragments range in size from 1mm to 1.5cm and are welded together with flattened pumice shards? Fragments are primarily subrounded. Many fragments are green and rimmed with purple alteration product.

354.93 Unwelded, lithified, poorly sorted sedimentary unit consisting of angular to subrounded clasts of basaltic material ranging in size from 1-4mm. Matrix is about 10% of rock and consists of very fine-grained, green, sandy silt. Unit has graded to massive beds 5-15cm thick.

VESICLES/AMYGDALES
None observed.

FRACTURES - VEINS - BRECCIA
Rare, hairline fractures filled with white material (zeolite?).

ROCK ALTERATION
Pervasive alteration to green and purple smectite, and minor amounts of calcite.

STRUCTURE
354.25 - 354.93 Tuffaceous segment with some welding (unit 58.1).

354.93 - 355.70 Bedded sediment (unit 58.1).

LITHOLOGY PETROGRAPHY - continues unit 64.1

Brecciated flow top becoming progressively more coherent and vesicular. Very amygdaloidal zone. Amygdales up to 1cm in diameter.

382.90 Transition to more massive unit showing some flow structure.

383.00 Green-grey aphyric basalt.

383.30 Becoming more massive.

VESICLES/AMYGDALES

382.45 Many amygdales filled with green smectite. Others only lined with smectite.

382.85 Large amygdale with interesting smectite/zeolite relations.

383.50 Large zeolite cavity.

FRACTURES - VEINS - BRECCIA

383.00 Dark smectite coated fracture.

ROCK ALTERATION

382.42 Smectite.

383.00 Smectite alteration along flow structure.

383.30 Smectite.

STRUCTURE

382.42 - 382.47 Flow breccia (unit 64.1).

382.47 - 382.90 Amygdaloidal basalt (unit 64.1).

382.90 - 383.69 Massive basalt (unit 64.1).

Box 65 , Section 1

LITHOLOGY PETROGRAPHY - continues unit 64.1
Green-grey, fine-grained basalt flow. Lithological change is minor. Compact.

386.10 Brecciation.

386.40 Partly milonitized.

VESICLES/AMYGDALES

Vesicles are very rare (less than 1% of rock).

386.20 Irregular shape, sometimes reach up to 2cm, usually about 5mm. Outer part - green smectite, filled with calcite or laumontite.

FRACTURES - VEINS - BRECCIA

385.20 Fracture - angle 12°.

385.30 Fracture - angle 15°.

385.34 Vein - angle 60°; green smectite and calcite.

385.39 Vein - iron oxide (thickness about 1mm).

385.50 Fracture - angle 15°. Vein - calcite (about 1mm).

385.63 Vein - calcite (about 1mm).

Many small veinlets usually (calcite and green smectite).

386.10 Many fractures and veinlets. Brecciation intense.

ROCK ALTERATION

385.20 Green smectite.

386.10 Intensely altered green smectite. Iron oxides and calcite.

386.60 Iron oxides prominent.

STRUCTURE

385.20 - 386.20 Fine-grained, aphyric basalt (unit 64.1)

386.20 - 386.71 Breccia (unit 64.1).

LITHOLOGY PETROGRAPHY - continues unit 64.1

386.85 Unit 65.1. Boundary is concordant but alteration minerals are very abundant within 10cm scoriaceous tuff breccia. The size of breccia up to more than 10cm, brownish green colour, the shape of the breccia is irregular.

387.30 The parts rich in calcite and zeolites are light colour. The parts rich in smectite are greenish colour. Iron oxide contributes reddish colour, but the amount is minor.

387.90 Fairly brittle, loose, density of the rocks low.

VESICLES/AMYGDALES

None observed.

FRACTURES - VEINS - BRECCIA

387.30 Many irregular shaped fractures. Usually composed of calcite and/or zeolites (fine-grained). Orientation of the flattened vesicles are also irregular.

ROCK ALTERATION

386.85 Iron oxides, green smectite, zeolites and calcite.

387.30 Highly altered calcite, zeolite (mostly laumontite) green smectite, especially just surrounding portion of each breccia are intensely altered.

387.90 Calcite is very abundant. Well crystalline calcite in vug (diameter about 2cm).

STRUCTURE

386.71 - 386.84 Unit 64.1

386.85 - 387.70 Unit 65.1 ; Scoriaceous tuff breccia.

387.70 - 388.19 Brecciation more prominent (unit 65.1)

U.65.1

LITHOLOGY PETROGRAPHY - continues unit 65.1
Greyish-bluish-green coloured breccia (up to 10cm).
Scoriaceous.

388.90 Become loose, soft that is caused by porous vesicles
389.15 These porous parts might have been filled with smectite. The drilling water might have drained away.

VESICLES/AMYGDALES
None observed.

FRACTURES - VEINS - BRECCIA

Veinlets are usually discontinuous. Irregular pod-like shaped calcite, clusters and/or zeolite clusters are fairly common.

ROCK ALTERATION

Calcite, zeolite, green smectite commonly occurs.

STRUCTURE

Scoriaceous breccia (unit 65.1).

Box 66 , Section 1

LITHOLOGY PETROGRAPHY - continues unit 65.1

Dark grey breccia with scoriaceous clasts, varying in size up to 10cm. Scoria vesicles empty, as in weathering, but may only be the result of circulating drill water, as the whole unit is extremely soft. Upper 30cm seems to lack large clasts.

VESICLES/AMYGDALES

Vesicles in scoria are voids or filled with dark smectite. Calcite and zeolite present in disseminated form in groundmass.

FRACTURES - VEINS - BRECCIA

Fractures generally subhorizontal, two at 30°.

ROCK ALTERATION

None observed.

STRUCTURE

391.01 - 391.40 Breccia (unit 65.1).

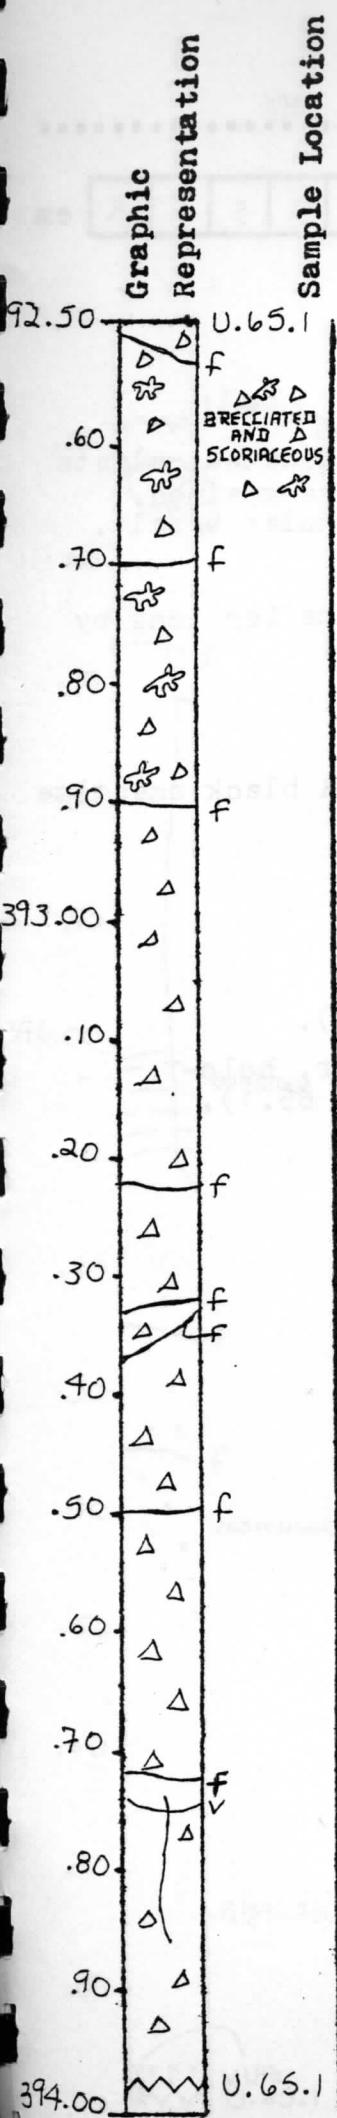

391.40 - 392.44 Scoriaceous breccia (unit 65.1).
